Glossary

Term	Definition
Array Area	The area in which the generation infrastructure (including Wind Turbine Generators and associated foundations and inter-array cables), Offshore Electrical Platform(s), and an interconnector cable will be located.
Developer	Muir Mhòr Offshore Wind Farm Limited
EIA Regulations	Collectively the term used to refer to The Electricity Works (Environmental Impact Assessment) (Scotland) Regulations 2017, The Marine Works (Environmental Impact Assessment) Regulations 2007, and The Marine Works (Environmental Impact Assessment) (Scotland) Regulations 2017.
Floating Foundations	The floating structures on which the Wind Turbine Generators are installed.
Inter-array cables	Cables which link the wind turbines generators to each other and the Offshore Electrical Platform(s).
Interconnector cable	Cable which links the Offshore Electrical Platform(s) to one another, allowing for power to be transferred between the platforms.
Landfall	The area between Mean High Water Springs (MHWS) and Mean Low Water Springs (MLWS) where the offshore export cables are brought onshore.
Offshore Electrical Platform (OEP)	Offshore platform consisting of High Voltage Alternating Current (HVAC) equipment, details depending on the final electrical set up of the Project.
Offshore Export Cable Corridor (ECC)	The area within which the offshore export cables will be installed.
Offshore export cables	The subsea electricity cable circuits running from the Offshore Electrical Platform(s) to the landfall which will transmit the electricity generated by the offshore wind farm to the onshore export cables for transmission onwards to the onshore substation and the national electrical transmission system along with auxiliary cables such as fibre optic cables.
Offshore transmission infrastructure	The proposed transmission infrastructure comprising: Offshore Electrical Platform(s) and associated foundations and substructures; the offshore export cables; and the landfall area up to Mean High Water Springs (MHWS).
Project	Muir Mhòr Offshore Wind Farm – comprises the wind farm and all associated offshore and onshore components.
Proposed Development	The offshore Muir Mhòr Offshore Wind Farm project elements to which this Offshore EIA Report relates.
Wind Turbine Generator (WTG)	The wind turbines that generate electricity consisting of tubular towers and blades attached to a nacelle housing mechanical and electrical generating equipment.

Acronyms

Term	Definition
AfL	Agreement for Lease
CEA	Cumulative Effects Assessment
EIA	Environmental Impact Assessment
EIAR	Environmental Impact Assessment Report
EMODnet	European Marine Observation and Data Network
GIS	Geographic Information System
KIS-ORCA	Kingfisher Information Service – Offshore Renewable & Cable Awareness
MD-LOT	Marine Directorate – Licensing Operations Teams
MHWS	Mean Water High Spring
NSTA	North Sea Transition Authority
OLA	Options for Lease
O&G	Oil and Gas
OEP	Offshore Electrical Platform
WPA	Whole Project Assessment
WTG	Wind Turbine Generator
ZoI	Zone of Influence

1. OFFSHORE CUMULATIVE EFFECTS

1.1. INTRODUCTION

1.1.1. Muir Mhòr Offshore Wind Farm Limited (hereafter referred to as 'the Developer') is proposing to develop the Muir Mhòr Offshore Wind Farm (hereafter 'the Project'). The Project is made up of both offshore and onshore components. The subject of this Environmental Impact Assessment Report (EIAR) is the offshore infrastructure of the Project seaward of Mean High-Water Springs (MHWS) which is hereafter referred to as 'the Proposed Development'.

1.1.2. The Muir Mhòr Array Area covers an area of approximately 200 km^2 and is located approximately 63 km east of Peterhead on the east coast of Scotland. The offshore infrastructure of the Proposed Development includes wind turbine generators (WTGs) and associated floating foundations, the Offshore Electrical Platforms (OEPs) and associated foundations, the inter-array cables, interconnector cable, offshore export cables and landfall.

1.1.3. Cumulative Effect Assessment (CEA) is a legal requirement under the EIA Regulations (see Volume 1 Chapter 2 (Legislation and Policy Context). These 'EIA Regulations' set out the statutory process and minimum requirements for CEA, to which the Proposed Development has adhered to.

1.1.4. The EIA Regulations enact the requirements of the EIA Directive through relevant Scottish legislation for electricity generation projects requiring consent under Section 36 of the Electricity Act 1989 by the Electricity Works (Environmental Impact Assessment) (Scotland) Regulations 2017 (as amended). In relation to marine licensing under the Marine (Scotland) Act 2010 and Marine and Coastal Access Act 2009, the requirements of the EIA Directive are enacted by the Marine Works (Environmental Impact Assessment) Regulations 2007 (as amended) and the Marine Works (Environmental Impact Assessment) (Scotland) Regulations 2017 (as amended).

1.1.5. A CEA provides consideration of the likely significant effects (as used in the EIA Regulations) arising from the Proposed Development alone and cumulatively with other relevant plans, projects and activities. Cumulative effects are the combined effect of the Proposed Development in combination with the effects from several different projects and/or plans, on the same receptor or resource.

1.1.6. A fundamental requirement of undertaking the CEA is to identify those projects, plans and activities with which the Proposed Development may interact to produce a cumulative impact. These interactions may arise within the construction, operation and maintenance or decommissioning phases of the Proposed Development.

1.1.7. The objective of this appendix is to set out the process to methodically and transparently screen the large number of projects, plans and activities that may be considered cumulatively alongside the Proposed Development. This involved a staged process that is set out below:

- Stage 1: Established the Project's Zone of Influence (ZoI) and identify a longlist of 'other development';
- Stage 2: Screening of longlist: Identified a shortlist of 'other development' for the CEA; and
- Stage 3: Information within the shortlist generated at Stage 2 is collated to inform the CEA.

1.1.8. The methodology for the staged process is set out in detail in Section 1.4.

1.1.9. The CEA longlist of projects, plans and activities with which the Proposed Development may potentially interact to produce a cumulative impact is presented within this appendix (Annex A).

1.1.10. The approach to the offshore CEA is intended to be specific to the Proposed Development and takes account of the extensive available knowledge of the environment and other activities in the vicinity of the Proposed Development.

1.1.11. Where applicable, EIAR Chapters have included a Whole Project Assessment (WPA) section. The aim is to assess if any pathways exist for onshore elements of the Project to impact offshore receptors alongside the Proposed Development. A tiered approach has been applied when assessing the potential for cumulative effects from the Proposed Development (see Section 1.4 Stage 3). Each tier reflects a Project's current status within the planning and development process. The Whole Project (both onshore and offshore elements) is acknowledged in the definition of Tier 1.

1.2. POLICY, LEGISLATIVE CONTEXT AND GUIDANCE

1.2.1. All the legislative requirements are discussed in detail in Volume 1, Chapter 2 (Legislation and Policy Context). However, specifically CEA requirements are as stated in the EIA Regulations. For example, Schedule 4, section 6 of The Marine Works (Environmental Impact Assessment) (Scotland) Regulations 2017:

'The description of the likely significant effects on the factors specified in regulation 5(3) should cover the direct effects and any indirect, secondary, cumulative, transboundary, short-term, medium-term and long-term, permanent and temporary, positive and negative effects of the works. This description should take into account the environmental protection objectives established at Union or Member State level which are relevant to the works including in particular those established under Council Directive 92/43/EEC on the conservation of natural habitats and of wild fauna and flora(1) and Directive 2009/147/EC of the European Parliament and of the Council on the conservation of wild birds'.

1.2.2. In line with this requirement, a description of likely significant cumulative effects is provided in each technical chapter of the EIAR, aside from where a CEA has been screened out.

1.3. CONSULTATION

1.3.1. Ongoing statutory and non-statutory consultation and incorporation of feedback is an integral part of developing a robust EIAR. The Offshore Scoping Report (Volume 3, Appendix 5.1 (Offshore Scoping Report)) for the Proposed Development (Muir Mhòr Offshore Wind Farm Limited, 2023) was submitted to the Marine Directorate – Licensing Operations Team (MD-LOT) in June 2023. In response to the Scoping Report, MD-LOT provided a Scoping Opinion (Volume 3, Appendix 5.3 (Offshore Scoping Opinion)), which collates the view per topic from regulators and key stakeholders.

1.3.2. Table 1-1 provides a summary of the stakeholder consultation activities specific to cumulative effects methodology. The issues raised and actions to address and incorporate this feedback into the EIAR are outlined. Please note that comments about topic-specific cumulative considerations are presented in the relevant EIAR chapters.

1.3.3. Further detail on the Proposed Development's overall EIA stakeholder consultation process and actions is presented in Volume 1, Chapter 5 (Consultation) of the EIAR.

Table 1-1 Consultation relevant to cumulative effects methodology

Date	Consultee and Type of Consultation	Description/ Issues Raised	How this has been considered in this Chapter
September 2023	MD-LOT Scoping Opinion	The Scottish Ministers are aware the Developer has sought a separate scoping opinion from Aberdeenshire Council for the associated onshore works. It is essential that the EIA Report concerning onshore works will be available at the time that the EIA Report for the Proposed Development is being considered so that all the information relating to the project as a 'whole' is presented. The EIA Report for the Proposed Development must consider any potential cumulative impacts with the onshore works.	Potential cumulative impacts from the Proposed Development and the onshore elements of the Project are considered in all assessments through the Whole Project Assessment and the CEA. Paragraph 1.4.33 sets out the tiers for the cumulative assessments for the Proposed Development, with onshore elements of the Project falling within Tier 1.
September 2023	MD-LOT Scoping Opinion	In regard to cumulative impacts, the Scottish Ministers highlight, and agree with NatureScot comments that potential impacts do not need to spatially overlap to have cumulative impacts.	Noted. The criteria for cumulative effects screening is set out in Table 1-3 and paragraph 1.4.16 *et seq.*

1.4. METHODOLOGY

OVERVIEW

1.4.1. Offshore wind projects in the North Sea region have been considered. The types of projects that have been reviewed, for inclusion in the Tiered approach include:

- Those that have become operational since baseline characterisation;
- Were operational at baseline characterisation but have an ongoing impact;
- Are under construction;
- Those with consent but are yet to be constructed;
- Those with a submitted application which is not yet determined;
- Those projects that have submitted a Scoping Report; and
- Plans and projects which are "reasonably foreseeable" (i.e. developments that are being planned), including, for example, offshore renewable energy projects which have an Option for Lease Agreement (OLA), Agreement for Lease (AfL) or exclusivity agreement.

1.4.2. Cumulative effects were assessed to a level of detail commensurate with the information that was available at the time of assessment.

1.4.3. In cumulative assessments, it is necessary to have an assessment cut-off date to allow time for the assessment to be undertaken and finalised prior to submission. As such, any projects, plans and activities that went into planning three months before application submission (22 August 2024) have not been considered for inclusion in the CEA longlist for the Proposed Development.

1.4.4. This definition of cumulative effects is the combined effect of Proposed Development in combination with the effects from several different projects, on the same single receptor/resource.

1.4.5. It is important to note that the term "in-combination effects" is used to describe as the combined effect of the Proposed Development, with the effects from other plans and projects, on the integrity of European Sites designated for their nature conservation value. In-combination effects are presented separately within the Report to Inform the Appropriate Assessment (Muir Mhòr Offshore Wind Farm Limited, 2024).

1.4.6. The CEA was undertaken using a three-stage approach as illustrated in Figure 1-1. This appendix presents the methodology associated with Stages 1 and 2, with the results of Stage 3 presented in each of the topic-specific EIAR chapters. However, an overview of the methodology associated with Stage 3 is presented within this document.

Figure 1-1 Cumulative Effects Assessment Methodology

1.4.7. Stages 1 and 2 focus on the creation and subsequent screening of the CEA long list which collates the details of operational, in construction, consented and proposed projects, plans and activities. This screening of the longlist leads to the creation of a topic-specific CEA short lists of projects, plans and activities taken forward and ultimately assessed within the cumulative assessments of EIAR chapters. Stage 3 is the undertaking the cumulative effects assessment for each screened in project, plan or activity. These assessments have been carried out on a topic-by-topic basis within the CEA section of the relevant EIAR chapter. The process for compiling the CEA long list and for screening the projects into or out of the cumulative assessments for chapters of the EIAR in addition to the completion of CEA is set out in the sections below.

STAGE 1 – ESTABLISHING THE CIA LONG LIST USING ZONES OF INFLUENCE

1.4.8. Under the first stage of the offshore CEA, a long list of relevant projects, plans and activities has been developed based on the largest of the ZoIs (see Table 1-2). The objective is to define the maximum geographical extent of the long list.

1.4.9. The long list includes the details of the relevant operational or planned projects, plans and activities including those in the UK and adjoining international jurisdictions and has been based on publicly available information available at the time of preparation.

1.4.10. For each physical, biological and human environment topic of the EIAR, the cumulative ZoI was defined based upon consideration of the relevant receptors, their study areas, the spatial

scales of potential impact pathways and the range and mobility of environmental receptors, representing the likely spatial extent over which cumulative impacts may occur.

1.4.11. Table 1-2 defines the search area extents that have been applied in developing the long list of other projects, plans and activities. It should be noted that these initial screening ranges are based on the maximum extents of potential impacts from those activities and are therefore considered to be highly precautionary. Impact-specific screening ranges used for individual topics have used reduced ranges depending on topic-specific criteria.

Table 1-2 CEA Offshore Long List ZoIs

Offshore EIA Topic	CEA ZoI	Rationale
Marine and Coastal Processes	Up to 15 km from the Proposed Development	Spring tidal excursion ellipse: the distance away from the Proposed Development over which suspended sediment plumes may be advected (and meaningfully interact with potentially sensitive receptors). The spring tidal excursion ellipse distance, or ZoI, has been defined from numerical modelling to extend 15 km.
Marine Water and Sediment Quality	Up to 15 km from the Proposed Development	
Benthic and Intertidal Ecology	Up to 15 km from the Proposed Development	
Fish and Shellfish Ecology	Up to 100 km from the Proposed Development	Underwater noise modelling has been used to determine a 100 km ZoI which is a highly conservative screening range encompassing any feasible propagation of underwater noise associated with an offshore wind project which would be detectable above background levels.
Offshore and Intertidal Ornithology	Up to 510 km from the Proposed Development	The ZoI has been defined due to foraging distance of the species with the largest distance scoped into the assessment. For the Proposed Development, this is gannet at 510 km.
Marine Mammals	Marine Mammal Management Units	As per NatureScot guidance provided in July 2024 species-specific Management Units (MMUs) have been used to screen projects for the long list.
Commercial Fisheries	The North Sea (all fleets except scallop dredgers)	The commercial fisheries cumulative study area has been defined as the North Sea, which is considered to be representative of the fishing grounds exploited by the fleets active across the regional study area, for all fleets except scallop dredging.
	The UK coastline (Scallop dredgers)	For scallop dredging the cumulative study area is defined at a UK level; this is because the UK fleet of scallop dredgers are nomadic in nature and target grounds across the North Sea, West of Scotland, Irish Sea and English Channel.
Shipping and Navigation	Up to 50 nm (92.6 km)	This CEA for Shipping and Navigation will consider the worst-case design scenario for each of the projects, plans and activities in line with the same methodology outlined in for the Proposed Development in isolation, including the assessment undertaken within the NRA to

Offshore EIA Topic	CEA ZoI	Rationale
		identify the anticipated worst-case shift in mean position of the main commercial routes within a 50 nm (9.26 km) buffer following the development of the Proposed Development and Tier 1 and Tier 2 cumulative projects (Tier 3 projects are assessed qualitatively only).
Marine Archaeology and Cultural Heritage	Up to 20 km from the Proposed Development	The Marine Archaeology and Cultural Heritage ZoI has been defined by a 20 km buffer around the Proposed Development. The ZoI is larger than the study area extent to capture any potential buffer of impacts from other surrounding developments.
Military and Civil Aviation	Up to 100 km from the Proposed Development	Assessment of potential cumulative impacts on Military and Civil Aviation receptors has considered projects to a range of 100 km from the array area. This distance is the maximum range at which radar cumulative effects are considered to occur. The potential cumulative effect of radar impacts on Air Traffic Control operations diminishes as the separation between wind farm sites increases. A separation distance of 100 km is considered to be a pragmatic range beyond which cumulative effects will be negligible.
Socioeconomics, Tourism and Recreation	The UK and Republic of Ireland	The main cumulative effects related to socioeconomics, tourism and recreation are expected to relate to the supply chain, as this is shared across the whole offshore wind sector. As a result, offshore wind developments elsewhere in Scotland, the UK or the Republic of Ireland have the potential to impact cumulatively with the Proposed Development.
Infrastructure and Other Maine Users	Dependent on receptor	Dependent on the receptor in question, in line with the maximum extents for Marine and Coastal Processes, Fish and Shellfish Ecology, Military and Civil Aviation and Socioeconomics, Tourism and Recreation.

1.4.12. Within the long list, projects, plans and activities were split into the following types or sectors:

- Offshore Energy;
- Aggregate and Disposal Sites;
- Oil & Gas (O&G) Infrastructure;
- O&G Pipelines;
- Subsea Cables; and
- Shipping and Ports.

1.4.13. All projects, plans and activities within the search areas defined in the table above have been identified through a Geographic Information System (GIS) study and a desktop study, using amongst others, the following data sources:

- The MD-LOT website;
- The Crown Estate Scotland website;
- The Planning Inspectorate National Infrastructure Planning website;
- The Crown Estate website;
- European Marine Observation and Data Network (EMODnet) data;
- Kingfisher Information Service – Offshore Renewable & Cable Awareness (KIS-ORCA);
- 4C Offshore;
- North Sea Transition Authority (NSTA);
- Offshore Energies UK website; and
- Developer and project proponent websites (numerous sources).

1.4.14. Further information on the projects, plans and activities within the refined long list was then gathered to inform the screening process (Stage 2). This involved a desk study to source publicly available information on projects, plans and activities using planning databases and internet searches. The relevant project parameters for the projects, plans and activities within the long list were also drawn from EIAs or other similarly detailed planning documents (i.e. licence applications) where possible. Information gathered included stages of development and construction dates as well as approximate distances to the Proposed Development for each project, plan and activity, to better understand any spatial and temporal overlap.

1.4.15. The cumulative long list for the Proposed Development is presented in Annex A.

STAGE 2 – SCREENING OF LONG LIST AND IDENTIFICATION OF TOPC-SPECIFIC SHORT LISTS

1.4.16. Having developed the CEA long list, all projects, plans and activities were screened for each EIAR topic, based on the level of detailed information available and the potential for interaction with the Proposed Development, whether this interaction be temporal, spatial or potential. For the temporal interaction with the Proposed Development a construction commencement date of 2029 has been assumed for the Proposed Development with construction taking place over period of up to four years.

1.4.17. This screening has produced topic-specific short-lists of projects to be considered further within the CEA as part of each EIAR chapter. It should be noted that this process may have screened a project in for one EIA topic but screened it out for another. The factors that were used to inform the CEA screening criteria are described below.

DATA CONFIDENCE

1.4.18. Data confidence is considered when screening projects, plans and activities into or out of the CEA. The premise here is that projects, plans and activities with a low level of detail publicly available cannot meaningfully contribute to a CEA and, as such, are screened out. The application of this screening step is consistent with Guiding Principle 7 of the RenewableUK Cumulative Impact Assessment Guidelines (RenewableUK, 2013).

1.4.19. Decisions upon whether to screen a project, plan or activity in or out at this stage are taken on a topic by topic basis based on experience and knowledge of technical specialists, and the current guidance and regulations. This allows certain projects, plans and activities to be screened in for certain topics where sufficient detail is present, while the same project, plan or activity may be screened out for another topic.

NO EFFECT - NO RECEPTOR PATHWAY

1.4.20. For a cumulative effect to occur, it must be established that a cumulative impact has the potential to directly or indirectly affect the receptor(s) in question. In EIA terms, this is described as an impact-receptor-pathway. An example of this can be seen where increased suspended sediment concentrations arising from a nearby project and from the Proposed Development (impact) affect the same population of fish and shellfish (receptor). Conversely, an impact-receptor-pathway cannot be demonstrated between activities such as the operation of a subsea pipeline and aircraft navigation. It is in cases such as this second example where projects, plans and activities are screened out at this stage.

1.4.21. Each project, plan and activity on the CEA long list has been considered on a topic-by-topic basis to evaluate the potential for impact-receptor-pathway overlaps to exist. Projects, plans and activities that clearly do not have such an overlap are screened out of the assessment such as radars. In cases where an impact-receptor-pathway is not clear-cut, the project, plan and activity in question has been screened into the CEA in order to consider the worst case. These projects are then further considered in the relevant topic chapters.

PHYSICAL OVERLAP

1.4.22. The ability for impacts arising from the Proposed Development to overlap with those from other projects, plans and activities has been assessed on a receptor basis for each topic. This means that, in most examples, an overlap of the physical extents of the impacts arising from the two (or more) projects, plans and activities must be established for a cumulative impact to arise. For example, for a cumulative sedimentation impact to be established between the Proposed Development and another project, it must be established that the extent of sediment release from both projects has the potential to overlap and may affect a receptor at a single physical place.

1.4.23. Exceptions to this exist for certain mobile receptors that may move between, and be subject to, two or more separate physical extents of impact from two or more projects. For example, marine mammals may be affected by noise impacts from the Proposed Development, as well as those from other projects where noise impact extents do not directly overlap with those from the Proposed Development. Furthermore, individual receptors from the same population may be subject to physically separate impacts occurring at the same time while the population is separated, leading to an effect upon the population. Where relevant, these potential eventualities have been noted in the relevant chapter and included in the CEA.

1.4.24. Screening based on physical extent has been carried out for all topics in line with the maximum potential impact (and hence physical extent) that may arise from the Proposed Development.

1.4.25. For the purposes of the CEA for the Proposed Development, all projects, plans and activities which do not have a physical overlap of impacts for a given EIA topic with those of the Proposed Development have been screened out. This approach is consistent with Guiding Principle 5 of the RenewableUK Cumulative Impact Assessment Guidelines (RenewableUK, 2013).

TEMPORAL OVERLAP

1.4.26. For a cumulative effect to arise from two or more projects, a temporal overlap of impacts arising from each must be established. Some impacts are active only during certain phases of development, such as piling noise during construction. Such a consideration is particularly important for receptors such as marine mammals, where the overlap of impacts during construction, such as noise from the piling activities of several large offshore developments, may be important. The anticipated construction, operational and decommissioning periods for projects, plans and activities within the CEA long list have been obtained from their relevant planning documents (e.g. Scoping Reports, EIARs etc.). The details provided represent the current understanding of programmes of development though it is recognised that these programmes may be subject to change.

1.4.27. For the purposes of the CEA for the Proposed Development, all projects, plans and activities that were built and operational at the time of the Proposed Development data collection (site-specific surveys etc.) have been screened out of the CEA. This is because the effects of these projects have already been captured within the Proposed Development site-specific surveys and/or baselines, and hence their effects have already been accounted for within the baseline assessment. The exclusion of built and operational projects that were in place at the time of data collection/survey in this way avoids the double-counting that would occur if projects were to be included within both the baseline and the CEA. The exception to this is where projects have an ongoing impact, and this is addressed by the screening criterion 'part of the baseline but has an ongoing impact'.

SCREENING CRITERIA DEFINITIONS

1.4.28. The screening process applied the defined screening criteria set out in Table 1-3.

Table 1-3 Screening criteria for the CEA longlist

a	Included as part of the topic baseline and hence not considered within the cumulative impact assessment: **Screened out of the assessment.**
b	Part of the baseline but has an ongoing impact and is therefore considered relevant to the cumulative impact assessment: **Screened into the assessment**
c	Potential cumulative impact exists: **Screened into the assessment**
d	No temporal overlap, nor potential for sequential cumulative effect: **Screened out of the assessment**
e	No physical effect-receptor overlap: **Screened out of the assessment**
f	Low data confidence: **Screened out of the assessment.**
g	No effect-receptor pathway: **Screened out of the assessment.**

1.4.29. Only where there is the potential for both spatial and temporal interaction between effects at the Proposed Development and one or more other projects/plans/activities, has a cumulative impact been taken forward for consideration in the CEA. The screening of the long list is set out in Annex A, identifying those projects screened in or out for further consideration based on one or more of the screening criteria. It is important to note that multiple screening criteria could apply to each project, plan and activity.

1.4.30. Once screening criteria have been applied, the project's screened in for each topic represent the shortlist taken forward for the tiered assessment presented in each chapter, set out in Stage 3.

STAGE 3- TIERED ASSESSMENT

1.4.31. In assessing the potential for cumulative effects from the Proposed Development, it is important to bear in mind that projects, predominantly those that are currently 'proposed', may or may not be taken forward for development. Therefore, there is a need to consider the certainty (or uncertainty) with respect to the potential impacts which might arise from such proposals. For example, projects which are already under construction are more likely to contribute to cumulative effects than those development applications that are not yet submitted.

1.4.32. For these reasons, all the relevant short list plans and projects have been allocated into 'Tiers', reflecting their current status within the planning and development process. This allows the CEA to present several scenarios, reflecting the varying levels of certainty of an activity proceeding and therefore the potential for impacts to arise that might act cumulatively with the impacts arising from the Proposed Development. Appropriate weight may therefore be given to each scenario (Tier) in the decision-making process when considering the potential cumulative impacts associated with the Proposed Development. For example, it may be considered that greater weight should be attributed to Tier 1 than Tier 2.

1.4.33. The CEA has applied the following Tiers:

- Tier 1 – The whole project (both onshore and offshore elements), combined with plans/projects which have become operational since the baseline characterisation of the Proposed Development, operational projects that have an ongoing impact, plus those that are consented and are yet to be constructed or under construction;
- Tier 2 – All plans/projects assessed under Tier 1, plus those projects that have submitted a Scoping Report or those pending determination following a submitted application; and
- Tier 3 – All plans/projects assessed under Tier 2, plus those projects that are not currently in the planning system but are likely to enter the planning system soon (e.g., OLA or AfL) where information is available to inform the cumulative assessment and there is sufficient data confidence.

1.4.34. The tier allocated to each of the projects considered within the topic-specific CEAs is presented in the CEA sections of each EIAR chapter and further detail on the topic-specific methodologies may be found in the relevant sections of the EIAR chapters.

1.4.35. Following on from the production of the topic-specific long lists, EIA topic authors have undertaken an additional information gathering exercise in relation to all plans, projects and activities that have been screened-in for each topic. This information gathering has then been used to inform the CEA assessments presented with each EIA topic chapter.
