1. Introduction

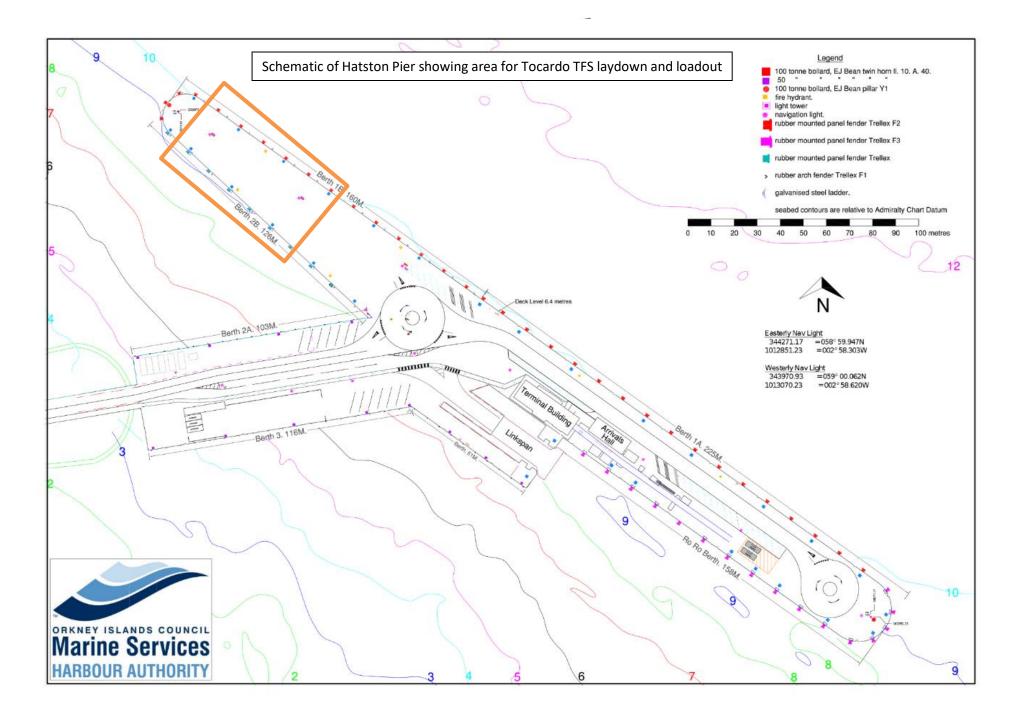

This document describes the various steps needed to install the TFS at berth 8 at EMEC. One part describes all on-shore works, the second part describes the offshore works. A part of the offshore works will happen during or even before the onshore works commence.

Although this document is drafted with 'installation' in mind, it can also be referred to for unplanned maintenance actions and decommissioning. The decommissioning will largely be the same plan in reversed order.

2. Locations

Hatston pier, Kirkwall, Orkney

3. Onshore assembly

3.1 Planned TFS assembly

The onshore execution plan for the work on Hatston pier is as follows:

Day 1

• The crane (100t) will arrive at Hatston Pier to stack the 2 sets of 10ft containers and a lower offload staging.

Day 2

- Put the 40 ft long TFS mid module on the lower staging
- Lift FRONT and AFT on plateau and attach sections together to form complete TFS
- Lift 6.6kV transformer inside TFS

Day 3

- Lift the strut in place for assembly to the bottom of the mid module.
- Lift the turbine in close proximity of the strut
- With 3 lifting slings the turbine will be lifted in place and hold in position for making up the connection to the pre-welded adapter plate.

Day 4-5-6-7

- The cables will be connected up.
- Outfit internal TFS (electric)
- Outfit externals TFS (railing, lighting)

The cables are ready in a spaghetti bundle so that these can be pulled in place and secured to the cable tray during the turbine assembly stage.

Tocardo personnel to electrically hook up the turbine to the cabinet in the LER and test the system. Ensure turbine is on brake and blades are horizontal. The pressure of the brake should be at the compressor stop level. Transformer is switched off (using lock out).

Day 8

- Prepare and install cable tail.
- Prepare and install mooring lines

Day 9

- 220t crane will be deployed
- Hoist TFS into water

With a 2 days' notice to the port and the crane supplier on day 9 the TFS will be lifted of the 10ft containers into the water.

After final inspection and check on water tightness and interlocking mechanisms, the TFS unit is ready for tow out to the final location.

Tocardo and their installation contractor will proceed to leave Hatston Pier once tides and weather are at the desired conditions.

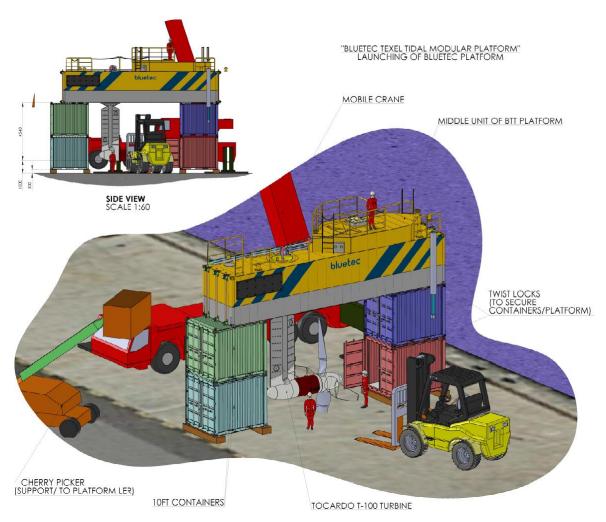

Image of TFS Load out in the Netherlands

3.2 Equipment

- Forklift
- 100t crane
- 220t crane (temporary)
- Cherrypicker
- Pallets
- Fencing
- 10" or 20" containers
- Rain cover for cabinets (sail of 3mx4m)
- Hand winches
- Pallet trolley to move cabinet around
- Movable scaffolding (2m in height)
- 32A extension cord (where the plug can be removed)
- Electrical tools
- Cable cutters
- Big cable cutters
- Cable lung crimping tool
- Drill with magnetic stand
- Hightorc wrench with m56 key

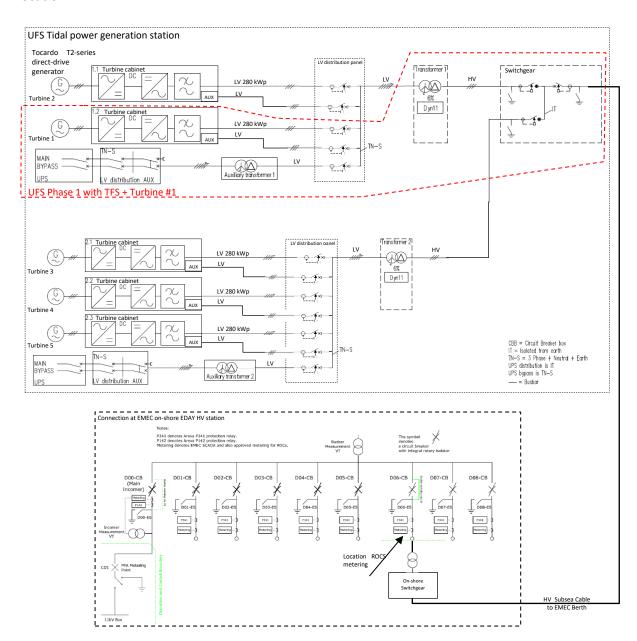

4. Eday shore station

All electrical connections need to be verified by EMEC before being approved. The installation of the equipment at the Eday substation will be done by Bryan Rendall Ltd, based in Kirkwall.

Bryan Rendall Ltd Tel: +44 (0)1856 879086

4.1 Single line diagram

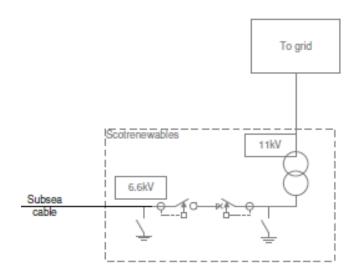

The next figure shows the single line diagram for the tidal power generation equipment and auxiliary equipment, including subsea export cable and on-shore connection with metering location.

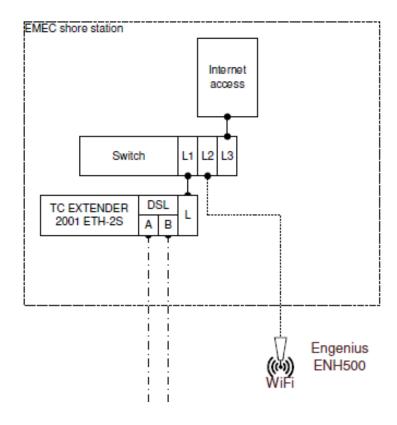

The first turbine installed using the TFS is shown as 'Turbine 1' on the single line diagram above. The TFS will have on-board the turbine cabinet of turbine 1, a smaller LV distribution panel and also a LV distribution AUX panel, a LV-HV transformer and switchgear. This is indicated in the above single line diagram in the red dashed section. The UFS and TFS subsea export cable will be connected to the same connection point at EMEC EDAY HV station as shown in the diagram. The meter and meter location will remain the same.

4.1.1 Onshore power electronics

4.1.2 Communication to shore station

4.2 Equipment list

The following table shows the main on-board equipment with power generation rating or power consumption rating if applicable for the UFS. Certain equipment will continuously need to consume power in for functionality of the power generation systems. Other equipment is sometimes required to operate and is normally on stand-by.

Equipment	No.	Power generation	Power consumption	Power consumption intermittent/
		rating	continuous	stand-by
T2 series direct drive tidal turbine	5	280kWp	-	-
generator		(grid side of		
generate		converters)		
Turbine auxiliary systems	5	-	0.8-1 kW	2 – 2.3 kW
(hydraulics, sensors, heaters, etc)				
Converter cooling system	5	-	3.1 kW	9.3 kW
Turbine control system	5	-	0.7 kW	0.2 kW
Array control system	1	-	0.3 kW	0.2 kW
Anti-Condensation heaters	11	-	-	0.2 kW
(inside cabinets)				
On-board lighting	1	-	-	0.2 kW
Nav aid systems with GPS	2	-	0.1 kW	-
UPS system	2	-	1.9 kW	-
ADCP (flow speed measurement)	5	-	0.3 kW	-

Other than the tidal turbine generators, there are no other power generation systems on board.

4.3 Metering location

The location of the ROCS meter is in front of the on-shore switch gear as shown in the single line diagram in section 2.1. At this location, the meter will measure the sum of power production and power consumption.

4.4 Planning

To be provided by Bryan Rendall Ltd before start of work.

5. Offshore works

The offshore works are based on the method statement by LEASK. A detailed planning is being drafted and will be updated over time. It is of essence to keep the offshore work companies updated on the progress onshore.

5.1 Equipment

All installation is done by use of a combination of one or two multicat vessels, a workboat, a RIB. Reference is made to the Vessel Management Plan for the description of these vessels.

Deployment of the TFS gravity anchors and device will be undertaken using a multi-cat vessel assisted by a support vessel such as a workboat and a RIB. The multi-cat is likely to be (or similar to) Leask Marine's MV C-vessels shown in Figures B.1-B.3 and a typical RIB is shown in Figure B.4. Vessel information is provided in **Error! Reference source not found.**.

Example multi-cat vessel

Example support vessel - Workboat

Example support vessel - rigid inflatable boat (RIB)

The selection and contracting of vessels is primarily driven by market conditions, vessel availability and ultimately, cost. Therefore, the actual vessels will be selected near to the time of works. Tocardo will confirm the project vessel spread with Marine Scotland at the earliest possible opportunity prior to works commencing as required (as per normal maintenance activities).

5.2 Communication and safety

Portable handheld VHF radios will be utilised. Contact details amongst each party will be shared.

Prior to daily works commencing, the operations team will carry out Toolbox meetings to be led by the Offshore Project Manager.

An OIC vessel will be arranged by the marine contractor for a 24-hour standby in case of emergency.

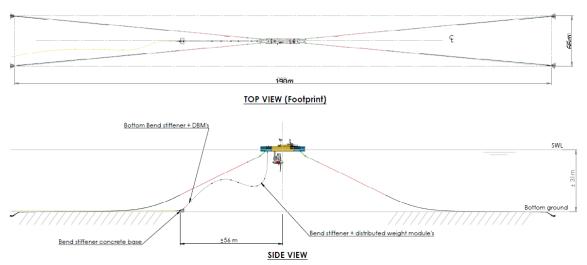

5.3 Installation

Technical details of the TFS device can be found in Section 4.1 of the Project Information Summary (Tocardo, 2017).

5.3.1 Anchoring

During the onshore works and successful award of the marine licence consent, the gravity anchors will be installed at the site. Each anchor consists of 30-40t clump weight in the form of scrap chain and 100m ground chain. Both sets of chain can be hoisted on board the multicat at Hatston pier. The multicat sails out to the site where it lowers the chain to the bottom at the correct coordinates. The installation of the 4 anchor points will take 4 days. It requires 3 engineers (vessel crew), 1 foreman and 1 crane operator.

Mooring view of TFS, gravity anchors not shown here, but will be used

5.3.2 Electrical

For this deployment the existing ScotRenewables SR250 electrical cable will be connected through a tail cable to the TFS device. The cable end is hoisted up to the multicat and fitted with a drymate wet connector. The end of the tail cable is plugged into the connector. The tail cable has the same specification as the subsea cable, but is supported by thick rubber bend stiffeners. The bend stiffeners prevent damage to the tail cable from bending, vibrations and inline tension. The tail cable is connected on board the TFS at the junction box when the TFS arrives.

Summarizing:

- Safe padlock the electrical works;
- Locate end of cable with divers
- Attach hoist to end of cable
- Lift the export cable onto the vessel deck;
- Splice the cable and fit the dry-mateable connector;
- Connect the tail cable;
- Lower connector and cables to seafloor while holding the end of the tail cable;
- Hoist the end of the tail cable through the TFS; and
- Connect it.

Note that this requires divers.

5.3.3 TFS installation

After the onshore works at Hatston pier, the device will be crane-lifted into the water and then one workboat or multi-cat vessel will be used to tow the platform. A small support craft such as a RIB, will help during the tow. A crew of 4 technicians and 1 operations manager is needed. At site;

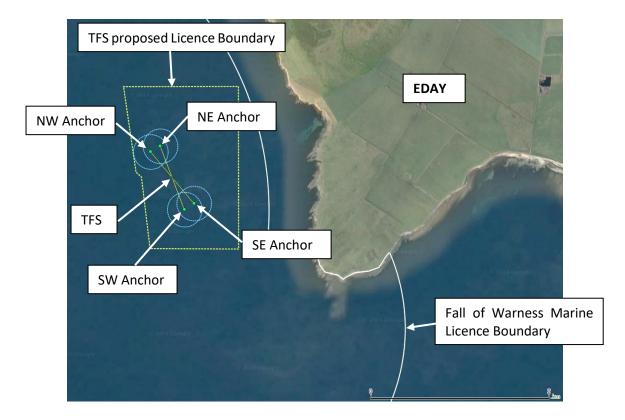

- The mooring lines will be attached and tensioned
- The tail cable end is hoisted into the TFS

5.4 Coordinates

The coordinates of the anchor points and TFS are given in the table below.

			North	East

5.5 Planning

A high level plan is given in appendix A.

5.6 Routes

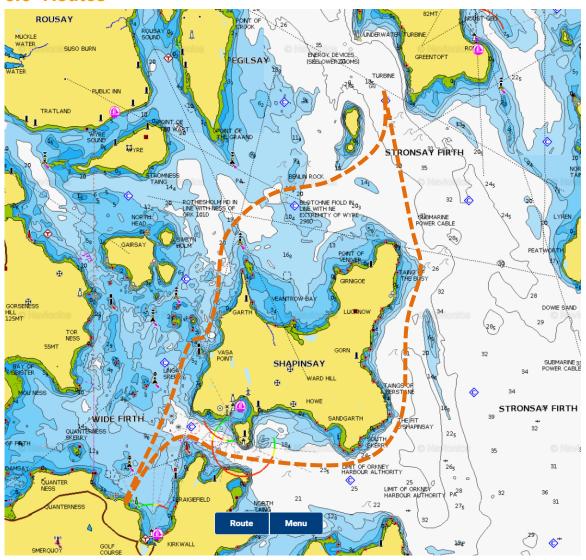

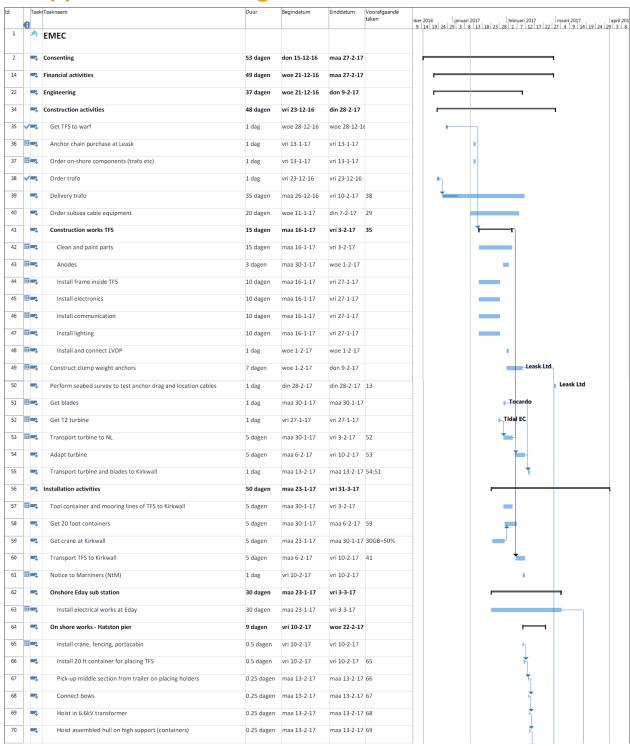

Chart image of likely routes to and from site. The east passage of Shapinsay Island allows for more depth, the west passage is very well possible too, when tide and weather window is correct.

The sailing routes are well known to the local marine contractor. Two routes can be taken, west or east of Shapinsay. The chosen route will be determined by the vessel's Super Intendent on the day and will be primarily based on weather conditions and tide tables.
